

Windows Network Recovery Toolkit — Project Instructions

Technology Risk & Control Analytics — not antivirus, EDR, or autonomous security software

- Windows endpoint evidence: proxy drift, TLS-path comparison, incident classification, control tests, audit reports, governance exports
-

```
python -m windows_network_toolkit
```

Observation—proof
Correlation—causation
Classification—accusation
Policy allow—safety guarantee
Always keep limitations—

- **Dry-run defaults:** Always simulate first.
- **Explicit confirmation:** Requires typed token, e.g., "**DISABLE_WININET_PROXY**" to execute.
- **Critical scripts:** Do not modify safety.py, proxy_remediation.py, or proxy_guardian.py without full review.
- Ensure **backups** of all configurations before proceeding.

Agent Editing Protocols:

BEFORE:

- **Ruff check --fix [file.py]**
- **commit local changes**
- **Verify agent isolation mode.**

AFTER / MAINTENANCE

- **No direct file edits (e.g., .py, .exe)**
- **Utilize defined hooks for customization.**
- **Periodic reverification of agent integrity.**
